Acknowledgements

NQSTI would like to thank all the academic organizations participating in the "Technology Transfer" activity. Specifically, we are grateful for the networking and data collection role developed by institutional referents for Spoke 8: Giuliano Muzio (FBK), Pasqualantonio Pingue (SNS), Monia Gentile (SSSAP), Samuele Morales (IIT), Agostino Lanza (INFN), Antonio Cassinese (UniNA), Chiara Mustarelli (INO-CNR), Milena D'Angelo (UniBA), Annamaria Cucinotta (UniPR), Alberto Leporati (UniMIB), Roberto Gunnella (UniCAM), Fabio Dell'Acqua (UniPV), Matteo Mannini (UniFI).

NQSTI expresses special appreciation to Francesco Izzo (UniNA) for useful suggestions and comments.

PREFACE: *NQSTI*, the *National Quantum Science and Technology Institute*

Claudio Pettinari
NQSTI President,
Full Professor of General and Inorganic Chemistry
Università degli Studi di Camerino

Quantum science and technology is rapidly reshaping the frontiers of innovation, offering transformative potential across communication, computation, sensing, and secure information. In this dynamic context, Italy has taken a decisive step forward with the establishment of the ***National Quantum Science and Technology Institute*** **(***NQSTI***)** — a coordinated national effort designed to strengthen the country's leadership and competitiveness in the quantum domain, a consortium that was founded by 20 Italian entities, but is currently expanding.

Supported by PNRR investments, *NQSTI* has created an integrated ecosystem that connects universities, research institutes, and industrial partners. This network not only enhances access to state-of-the-art infrastructures but also promotes technology transfer, cross-disciplinary collaboration, and advanced training for the next generation of quantum scientists and engineers. A recent and relevant milestone achievement in this process has been the creation of **Quantum Technology Fabs** designed to support industry and academy researchers in prototyping and validation of quantum devices - a concrete foundation for long-term life and sustainability and innovation capacity.

Today, *NQSTI* represents both a scientific hub and a strategic instrument for national growth. Its coordinated model supports Italy's participation in the European quantum agenda and ensures alignment with international initiatives. Through its open and collaborative approach, *NQSTI* stands as a **fundamental bridge between research, industry, and policy**, providing expert insight and evidence-based guidance for building the future of quantum technologies in Europe.

The fall of 2021 saw the creation of a group of 23 experts from Academia and Research institutions, following the publication of the Italian government guidelines. These experts shared an analysis of the QST know-how available in the country, of the obstacles to its full valorization and translation into economic growth and sustainable development, and a vision of the main directions capable of bringing the radical innovation requested by the guidelines. This study was then shared with leading enterprises operating in Italy: new goals and needs completed the report. The analysis represented the starting point for the elaboration of the ***National Quantum Science and Technology Institute*** as a PNRR proposal. The *NQSTI* coordination's programs aim **to overcome the current structural weaknesses** of the Italian systems, such as fragmentation of research lines and organizations, scarcity of personnel, poor funding, inadequate digital infrastructure, and lack of exploitation of the existing facilities/laboratories.

NQSTI's vision is that the extraordinary PNRR funding must be used to update technical facilities and strengthen the QST community in the next few years, but even more importantly, it must be channeled to drive the national community into an ordinary and sustainable condition of increased impact, visibility, and capacity to modernize and support the competitiveness of the Italian economy.

The ***National Quantum Science and Technology Institute*** (*NQSTI*) is a consortium that intends to:

(i) team up Italian entities carrying out competitive and innovative research in the field of quantum science and technology (QST), and

(ii) stimulate future industrial innovation in the field, providing a forum in which novel ideas and opportunities are transferred to companies.

In order to ensure a long-term positive effect on the Italian economic growth and development, the whole innovation chain was considered: from the strengthening and coordination of the low-TRL research, to its translation into prototypes, favoring interfacing with industrial needs thanks to strong outreach and continued-education programs.

The ***National Quantum Science and Technology Institute*** long term goal is to contribute to the establishment in Italy of a Knowledge Transfer (KT) System for Quantum Technology i.e. to manage the activities and the processes through which knowledge, expertise and qualified personnel flow between the research system (institutes, universities, research centers) and the community of end users in the industrial sectors, in commerce, in the service and in the public sectors.

Within *NQSTI,* the goal is to create a dedicated **single-point provider for SMEs** where they will be able to find educational programs for their existing staff, new QST-trained personnel, and opportunities to innovate products and processes by participating, through dedicated open calls, in collaborative projects with our project participants. ***NQSTI* aims particularly to effectively connect low-TRL research with companies' R&D divisions**, either by leveraging on the existing industrial infrastructure or by stimulating the creation of new companies.

Serafino Sorrenti
NQSTI Honorary Chair
Chief Information Security Officer (CISO)
Presidency of the Council of Ministers of the Italian Government

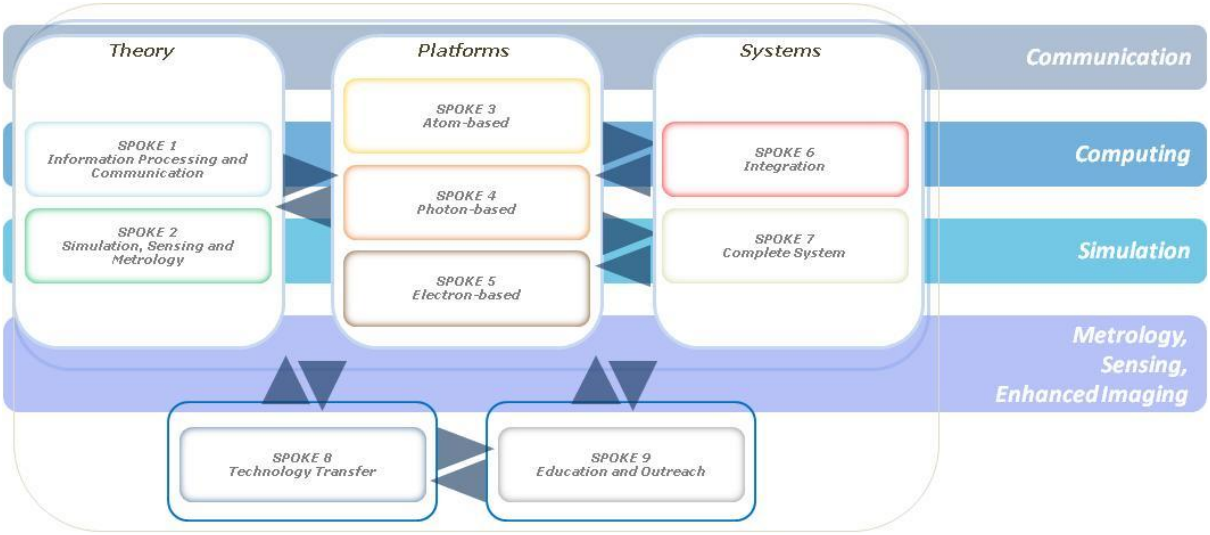
The ***National Quantum Science and Technology Institute*** **(*NQSTI*)** constitutes a precious national asset for the advancement of quantum technologies in Italy. Its **coordinated structure, scientific excellence, and deep understanding** of both the national and international quantum ecosystem make it an **indispensable partner** to the vigorous governmental initiatives currently shaping this strategic domain.

Thanks to its technical competence and **extensive network**, *NQSTI* serves as an **authoritative interface** between the research community, industry, and policy makers. In this pivotal phase of

the digital transition, it plays a crucial role in supporting the integration of quantum-driven innovation into Italy's technological and industrial fabric.
This document is a tangible example of how ***NQSTI*** can serve as a **reliable and timely source of information and analysis** to assist policy makers in monitoring progress and shaping informed strategies for the future of quantum technologies in Italy.

***NQSTI* is organized in 9 Spokes**: the first 2 dedicated to establishing the theoretical and conceptual framework of the systems to be developed, and the following 3 dedicated to the technological platforms needed to implement those concepts defined in terms of the quantum of choice (atoms or molecules, photons, electrons), Spoke 6 dedicated to the integration of the developed devices into functional modules, Spoke 7 dedicated to research on system architectures. Spokes 8 and 9 are transversal Spokes dedicated to Technology Transfer and Education and Outreach, respectively (see *figure 1*).

Figure 1. The NQSTI Spokes' structure



Overall, the Partnership comprises 20 participants (public, non-profit entities, and private companies). The Hub was set up in the form of a limited liability consortium (SCARL) with the involvement of all public participants and is hosted in CNR central seat in Rome.
Its mandate is:

- ensure the coordination and management of the overall program towards the Italian Ministry of Research (MUR) and the Spokes, according to the agreement with the MUR and European/national rules for expenditures;
- monitor Spokes and participants, address gender-equality issues and diversity management;
- provide recommendations on the most appropriate solutions for achieving the selected research results;

- coordinate and promote interactions among "Spokes" and with stakeholder organizations;
- provide centralized program management support (e.g., periodic workshops, website hosting, etc.);
- promote educational programs and workforce development.

Within the Hub organization described above, *NQSTI* is scientifically coordinated by a steering committee formed by the Spoke leaders and chaired by Professor Fabio Beltram. Each Spoke is organized with a scientific coordination team comprising all activity leaders, and managing coordination is ensured by the Participants' representatives.

Fabio Beltram
NQSTI Scientific Coordinator
Full Professor of Experimental physics of matter and applications
Scuola Normale Superiore

The ***National Quantum Science and Technology Institute (NQSTI)*** represents a strategic national initiative aimed at consolidating and advancing Italy's capabilities in quantum technologies. Through coordinated action and the support of **PNRR** funding, *NQSTI* has **modernized research infrastructures**, fostered collaboration among universities, research centers, and industry, **and trained a new generation of scientists**. Its **open and integrated model** has successfully unified national competences, enhanced technological platforms, and stimulated innovation and technology transfer. The recent establishment of **Quantum Technology Fabs** is particularly relevant since it ensures long-term sustainability by providing **shared facilities for the design, prototyping, and certification of quantum devices and systems**.
This document reflects ***NQSTI*'s strategic vision and outlines the national landscape of quantum technologies**, highlighting their essential role in strengthening Italy's scientific excellence, industrial competitiveness, and contribution to a vibrant quantum ecosystem.

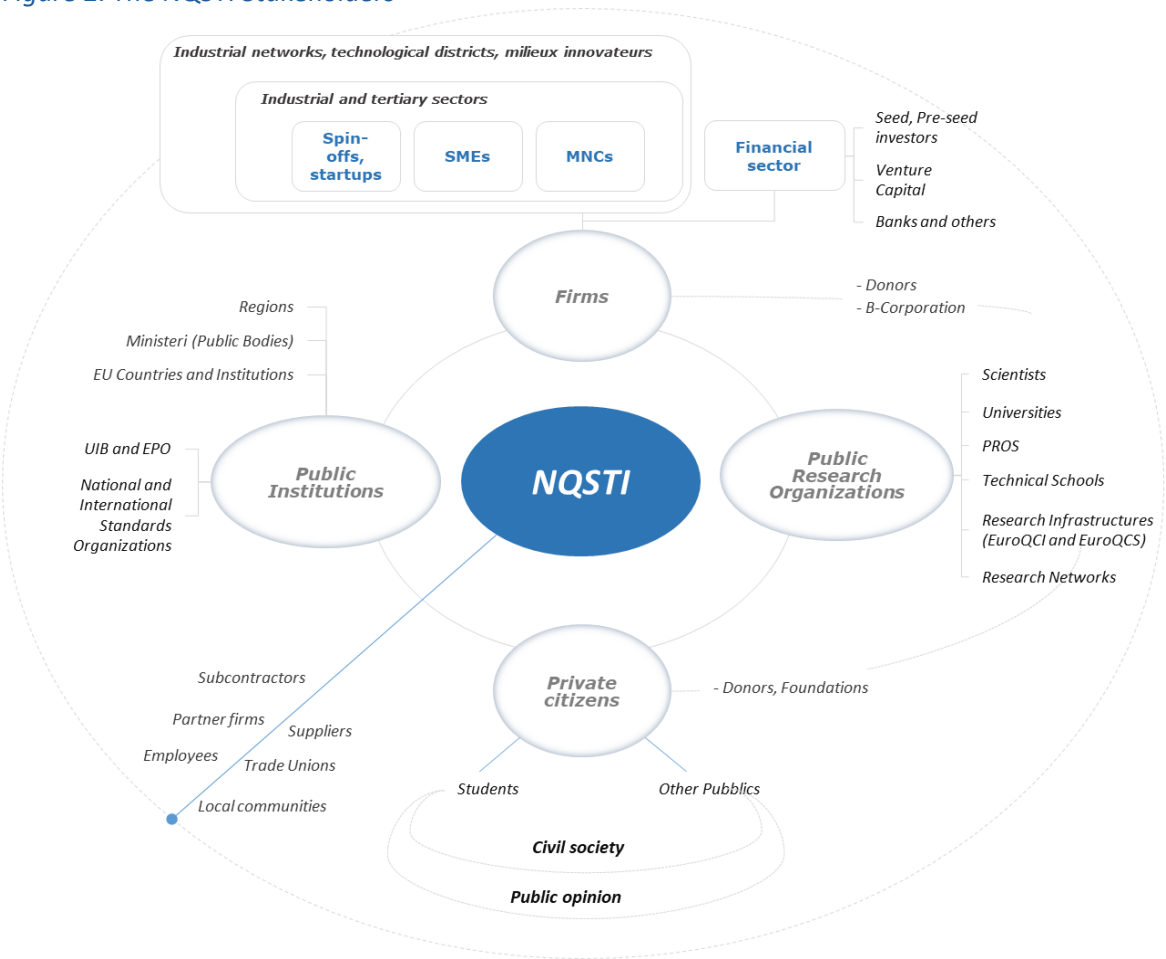
The knowledge transfer system for QST

NQSTI is designed to effectively coordinate the efforts to bring science and development within all main stakeholders, *in primis* Research Organizations, Universities, and Industry, reconciling the different purposes and time horizons (*figure 2*). This coordination will make it possible to overcome the current structural weakness that limits the ability to transform Italian *blue-sky* research into innovation. The aim is to create products and services with high added value, generating great opportunities for the social and economic well-being of the community (health, safety, energy, environment). It is equally necessary to combine the effort in research and innovation with a suitable upgrade of the education and training system. The goal to be achieved is the creation of a **learning ecosystem** capable of transferring the basic concepts of quantum science at all levels, from school to professional environments. It is necessary that the key concepts

of quantum mechanics become an integral part of the training curriculum for all innovation actors, starting with engineers and computer scientists, as well as, naturally, chemists and physicists. This not only serves to train workers ready for the quantum revolution but also to create an advanced, informed society with open knowledge and attitudes towards quantum technology.

The long-term vision of *NQSTI* is the establishment of a national institute capable of structuring human resources, technical infrastructures, public and private investments to promote scientific research, technological development, and, in the medium term, industrial adoption of QST. In other words, a new ecosystem of innovation in which today's ability to study and manipulate single quantum objects (atoms, photons, molecules, nano-devices) results in tomorrow's industrial applications (see *box 1*).

Figure 2. The NQSTI Stakeholders



Box 1. The National Research Plan for QST

The *National Research Plan 2021-2027* (*MUR*, 2020) sets a series of overarching objectives. Within the scope of the Extended Partnership and taking into account the other efforts financed within *M4C2* and by EC, the successful completion of our program will realize those objectives:

- Make Italy a key player of QST, both as a supplier of qualifying technologies, as a developer of integrated platforms and algorithms, and as an industrial end-user.
- Make Italy technologically independent by creating vertical production chains of quantum devices.
- Demonstrate the possibilities of QST for the increase in the efficiency of devices and systems and for improving the sustainability of industrial processes and the energy efficiency of consumer products.
- Set up at the national level a ***QT supply chain*** for:

i) integrated electro-optical, photonic and scalable hybrids;

ii) devices based on semiconductors, superconductors, molecular nanomagnets, photonic, atomic and hybrid systems;

iii) miniaturized quantum sensors based on neutral atoms, superconductors and opto-electro-mechanical devices;

iv) quantum imaging devices;

v) quantum interfaces capable of combining different platforms;

vi) test, validation and certification of QST systems.

All this is obtained by completing existing infrastructures, complementary in different areas (superconductivity, cryogenics, etc.).

- Create a *National Institute for Quantum Technologies* that allows to preserve and enhance the great national human capital and the key technologies for industrial development. *NQSTI* will have a federative role in the national community, and provide coordination and support between research and industrial development as well as between the different QST, within a network, and in synergy with the European strategy.
- Create new interdisciplinary paths of Higher Education (master's degree and doctorate) in this advanced and rapidly evolving scientific sector to prepare highly specialized staff and in possession of transversal skills involving industrial realities in training and academic research.

SPOKE 8 “Technology Transfer”

Among the various mechanisms to encourage the transfer of academic knowledge, the commercialization of research results (IPRs, licensing, spinoffs) is the tool that has generated the greatest number of insights in the last thirty years, both within the scientific literature and within institutional reports (*OECD* 2011, 2013, 2019). Although patenting and licensing activities represent effective ways to contribute to the development of the economy and society, several other ways exist through which scientific knowledge flows between public research bodies and non-academic organizations (see *box 2*).

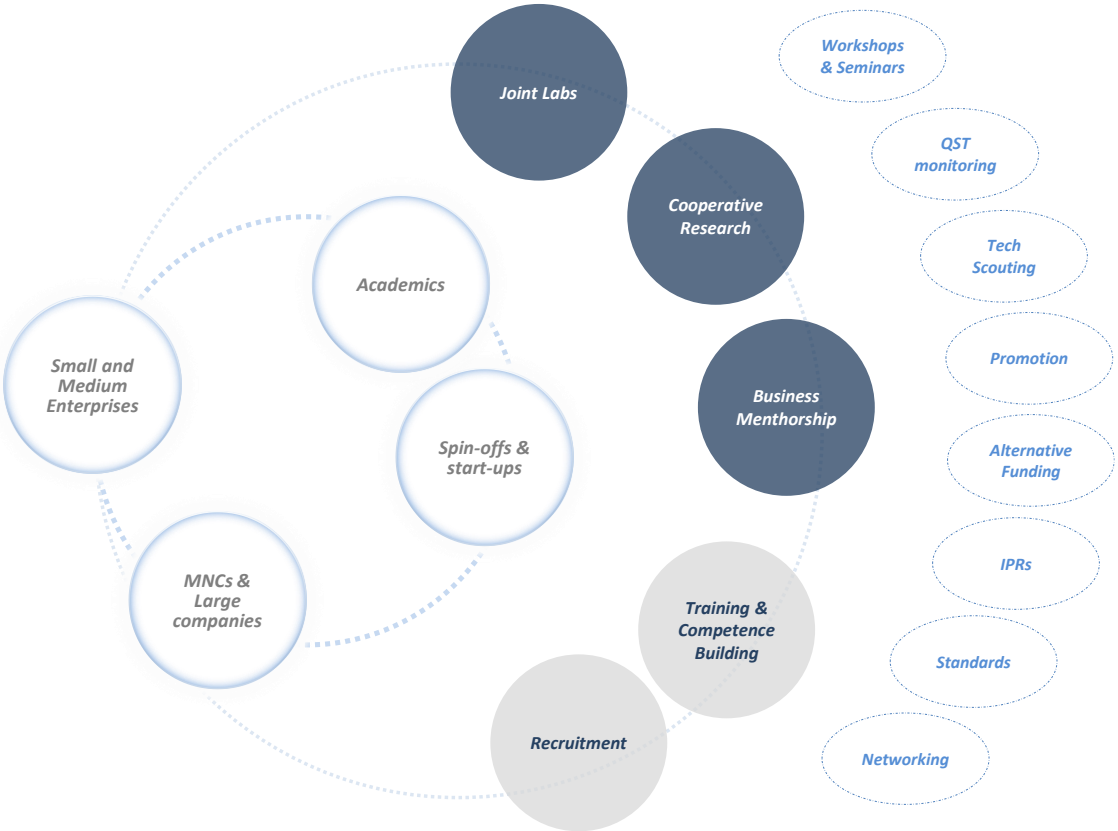
Box 2. The Knowledge transfer (KT) for the EU

Knowledge transfer (KT) is a concept used broadly to describe the **flow of (scientific) knowledge between research organizations (including universities and PROs) and business**, with the objective of creating socio-economic impact through promoting better use of the (public) research base. This concept replaced the formerly used “Technology Transfer” (TT) to reflect the wider knowledge base than just technology being transferred. Nowadays, the term “knowledge exchange” is used instead to reflect the fact that **the**

flow of knowledge is neither one-dimensional in the direction "research organization to industry', nor only between the players on this scale (multidimensional), *European Commission* (2014).
The *European Commission* (2020) underlines how Knowledge Transfer **is a complex process that involves many non-scientific and non-technological factors**, as well as many different stakeholders. Good or high-quality research results are not enough for successful technology transfer; **general awareness and willingness,** both at the level of organizations and individuals, as well as skills and capacity related to specific aspects, such as access to risk finance and intellectual property (IP) management, are also necessary components.

NQSTI intends to push for the adoption of the most diverse mechanisms of knowledge transfer, both formal and informal, with an interdisciplinary and holistic approach: cooperative research, joint laboratories, personnel exchanges, participation and organization of roadshows and fairs (see *figure 3*). The several channels of technology transfer, in fact, play a different role according to the specific context in which they develop and according to the objectives declared by the organizations participating in the process (see *box 3*). Furthermore, informal mechanisms are often important catalysts for more formal instruments of exchange (Debackere and Veugelers, 2005). [1]

Figure 3. The NQSTI "Knowledge Transfer" activities



[1] For more Information on NQSTI Spoke 8 "Technology Transfer" activities: https://nqsti.it/technology-transfer

Gaia Raffaella Greco, PhD
Spoke 8 "Technology Transfer" Coordinator
Researcher
Istituto di Calcolo e Reti ad Alte Prestazioni del Consiglio Nazionale delle Ricerche

"As actors in the *National Quantum Science and Technology Institute*'s technology transfer activities, we first have to **analyze and understand the national QST system**. Knowledge on the international and Italian industrial quantum structure is scarce and scattered across multiple sources (academic literature, consulting and institutional reports, *EU-Cordis* repositories, IPRs, and VC's datasets).
Incomplete Information could lead to incorrect or worthless decisions at the national level and in companies' long-term choices. **Strategic monitoring is** always **ongoing**"

Box 3. The main goals of NQSTI Knowledge Transfer

Main Goals of *NQSTI* "Knowledge Transfer" are:

*- to translate **basic research** into **applied knowledge**;*
*- to know and to **collaborate** with **science-based companies**;*
*- to **develop** "**academic engagement**" in knowledge transfer;*
*- to boost the **"absorptive capacity" of companies**;*
*- to **create trust** and promote **team spirit** within the NQSTI network;*
*- to **reduce** socio-cultural, organizational and technical **barriers** between academia and companies;*
*- to take advantage of all **formal** and **informal** collaboration tools;*
*- to encourage the creation of **new companies** in the sector;*
*- to train a **new class of scientists and entrepreneurs** in the sector;*
*- to **attract investments** and talents, also through internalization processes;*
*- to **inform** main stakeholders about Quantum Technologies, scientific developments, initiatives, and use cases implemented at the national and international level;*
*- to obtain the maximum **economic and social benefit to society** from research activities on the technological frontier.*

SPOKE 9 "Education and Outreach"

Carrying out the ambitious and highly innovative program of *NQSTI* requires highly qualified and specialized personnel who are able to operate within scientific and industrial organizations both at the national and international level in an extremely advanced and rapidly evolving scientific sector. From the point of view of human resources training, these characteristics pose non-trivial challenges, also considering that interdisciplinary skills are required, transversal with respect to the usual disciplines into which the university system is divided.
These needs originate from the academic/research world and are driven more and more from the industrial demand, where the interest in QT has rapidly increased in the last decade, initially stimulated by large multinational companies, and progressively also from small/medium enterprises and spinoffs, focused on specific devices and/or applications.

The level of Italian university education is generally very high and internationally appreciated. In the QT sector, at the time of the writing of the proposal, a few specific degree courses dedicated to QT were present, coming mostly from physical science. Recognizing the relevance of human resources training from the perspective of a longer-term horizon of the *PNRR* duration, *NQSTI* has decided to invest in the development of quantum-technology-oriented education and training via the activities and resources of *Spoke 9*. In this effort, special care has been devoted to guaranteeing wide access to the QST field, taking into account factors such as gender equality and diversity.
The activities carried out by *Spoke 9* encompass all the levels from high school to higher education, but it also includes the essential training at the professional level both of high-school teachers and of industry employees, which is required to increase the amount of highly qualified personnel towards quantum technology (see *box 4*).

Elisabetta Paladino, PhD

Spoke 9 "Education and Outreach" Coordinator
Full Professor of Theoretical physics of matter, models, mathematical methods and applications
Università degli Studi di Catania

"An extremely **advanced and rapidly evolving scientific sector** poses non-trivial challenges. We need an **interdisciplinary training system** that goes beyond actual academic departments. The industrial ecosystem, as well as the ambitious and highly innovative program of *NQSTI*, requires **highly qualified and specialized personnel**"

The effectiveness of these actions is tightly connected to the general awareness of the extraordinary revolution that QTs are bringing closer and closer to everyday life, as witnessed by the decision of the *United Nations General Assembly* to declare 2025 the *International Year of Quantum Science and Technology*. Because of the broadness of the research, knowledge transfer, education and outreach activities carried out at the national level and within international collaborations, *NQSTI* is one of the *Distinguished Partners* of the *IYQ*[2].
Another aim of *Spoke 9* is to raise awareness on QST of civil society, particularly with companies and professional organizations that do not yet know the potential of quantum technology but might become relevant stakeholders in the future. A vast number of outreach initiatives at all levels have been undertaken and are in progress in the course of 2025[3].
To implement this work program *NQSTI* has exploited the expertise on education and outreach of the consortium partners, firmly based on the output of the *Quantum Flagship Initiative* under the *QTEdu Coordination and Support Action* and on the

[2] More Information is on: *https://quantum2025.org/*.
[3] Detailed Information is on: https://nqsti.it/index.php/activities/outreach.

recommendation of the Italian *Programma Nazionale per la Ricerca 2021-2027* (*MUR, 2020*).

Box 4. The main goals of NQSTI Education and Outreach

Main goals of *NQSTI* "Education and Outreach" are:

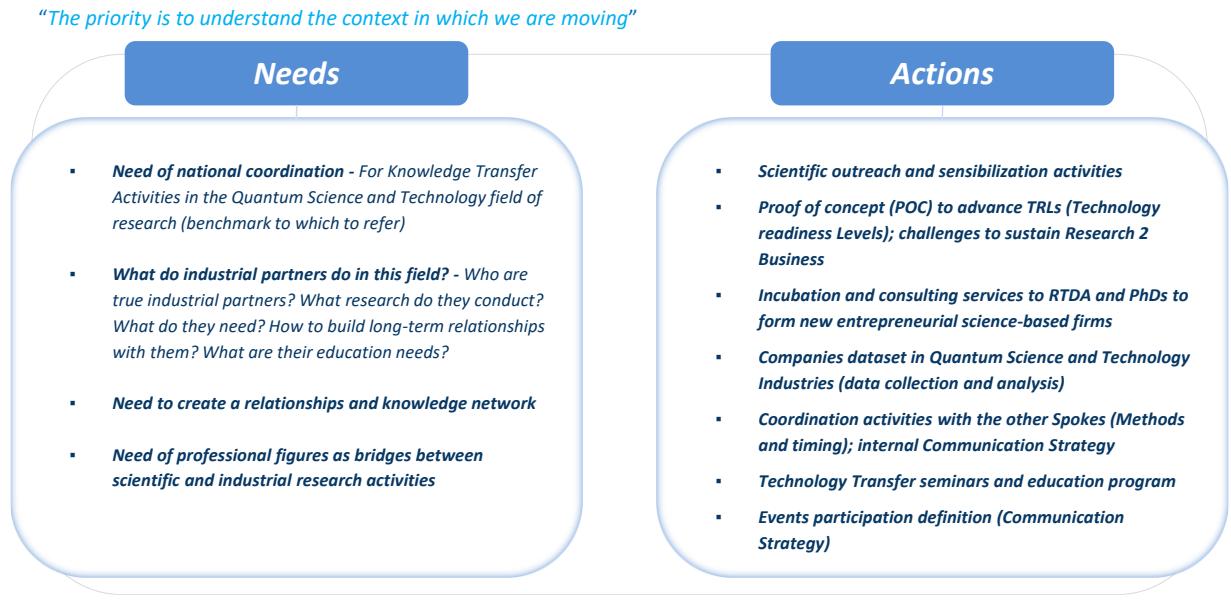
- ***Identification of QST educational strategies*** *and available infrastructures and services;*
- *Establishment of* ***training courses for high school teachers*** *on QST topics;*
- *Establishment of* ***scholarships for specialized QST-training in industry*** *or joining academia/industry labs;*
- *Activation of* ***specialization internships*** *within existing Masters;*
- ***Activation*** *of new I and II level* ***Masters*** *in dedicated academic/****industrial laboratories****;*
- *Organization of* ***outreach events for civil society*** *and of info days dedicated to industries.*

The *NQSTI* Report: purpose and objectives

NQSTI objective for all the academic institutions involved is to strengthen cooperation with the private sector in two complementary directions: inducing the research community to respond to the needs of industry and encouraging the latter to contribute to a re-launch of the technologies available to QST researchers.
Within the process of research valorization, one of the actions envisaged was the drawing up of a dataset of possible users of the knowledge produced inside the academic institutions. Furthermore, *NQSTI* aims at informing the academic, the industrial and the institutional stakeholders on major technical advances, state of development, use cases implemented, real-market applications, and standards definition at national and international levels.

The Italian industrial sector analysis was driven by the need to understand the main dimensions of the *Quantum Science and Technology National System*, to comprehend the principal variables of the internal market (geography, size, collaborations, and industries involved), and to fully channel fundamental Technology Transfer, Education, and Communication initiatives (see *figure 4*).

Figure 4. The first NQSTI TTOs' evidence



It emerged early in the first meetings among the *NQSTI* partners that there was a need for a clear understanding of the national Quantum technological context, analyzing the essential characteristics, the value chain, the collaboration capacity, the research cooperation culture, and the propensity of the firms in Italy. Specific questions remain:

- *How many firms in Italy work on QST research projects?*
- *Where are they?*

- *What are the main characteristics?*
- *Who is collaborating with whom?*
- *What are the main topics of investigation?*
- *In which industries do they operate?*
- *How do they build their cooperative networks?*

Science-based firms are defined as organizations where the main source of technology lies in the R&D activities of the companies themselves (Niosi, 2000). The knowledge resulting from research, pure and applied, which is carried out in universities and other public research centers flows, thanks to the collaborative activities carried out to companies. However, only a knowledge base created thanks to internal R&D activities allows the company to benefit from the research that is carried out in other organizations (Cohen and Levinthal, 1989).

The backbone of Italian enterprises is represented by SMEs that in many cases do not have the resources and expertise to take advantage of the Quantum Revolution that is going to be pervasive and will influence several economic sectors. Is this vision fully authentic?

Through the construction of an *original dataset of firms*, the *NQSTI* Report intends to represent a first picture of the Italian QST Knowledge system, shedding light on the leading actors, analyzing primary industrial sectors and applications, investigating the geographical distribution of companies and spinoffs, questioning the strategic missions, and reflecting on emerging trends.
The scope of the document is to describe the current efforts towards the implementation and deployment of quantum technology (QT) in Italy, through the presentation of the main global dynamics and politics. Notably, the report includes four separate Chapters.

The *First Chapter* presents an investigation of the *institutional and consulting literature on quantum technology and markets*, analyzing industrial segments (quantum communication, quantum computing and simulation, and quantum sensing), public and venture capital financing, outlooks, and trends on a global scale. The aim of the Chapter is to represent international dimensions broadly by comparing the most relevant references and offering insights for further in-depth analysis.

The *Second Chapter* introduces European policies related to Quantum Science and Technology, explicitly describing the *Quantum Flagship* initiative and the *Quantum Europe Strategy*. The scope of the Chapter is not to analyze single European national policies, but to contextualize the Italian national system of innovation inside the European general framework.

The *Third Chapter* analyzes the QST system by investigating the original *NQSTI* dataset. It presents a *comprehensive overview of Italian companies entering the quantum industrial sectors*. Several key highlights emerged, including the geographical distribution of these companies, the industries to which they belong, and the markets they serve. One particular section focuses on the role of Italian startups, emphasizing their growing importance in this field (a list of these startups is provided in the text).

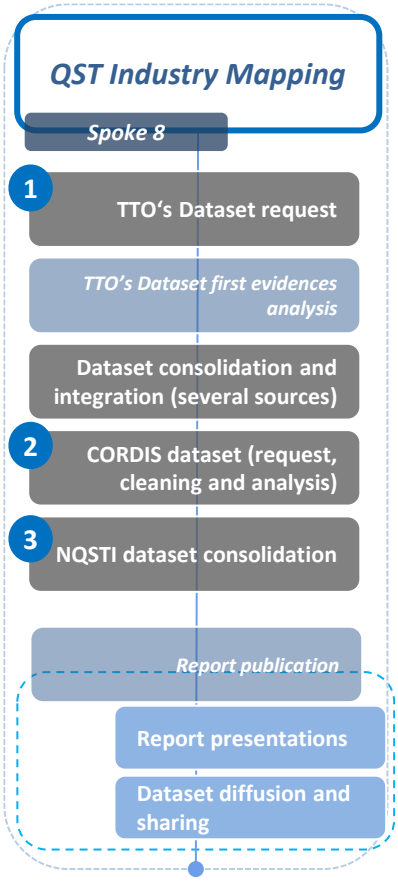
Finally, the Fourth Chapter aims to represent and analyze each Quantum "vertical" (computing, communication, simulation, and sensing), further highlighting synergies and interdependencies among them, and evidencing the relevant role played by supporting firms and other industries. Along with the analysis of the quantum sectors of application, a *particular focus will be on Italian research and industrial excellence, analyzing specific business case studies*.

Direct interviews were conducted to give voice to the protagonists who live in the Quantum industrial and scientific systems. Indeed, a specific set of questions has been asked to: ***academics*** with specific Technology Transfer backgrounds (*Chapter One*), ***venture capitalists*** operating in Italy (*Chapter Three*), and ***CEOs and research managers*** of QST firms (in *all Chapters*).
Relevant questions pertain to actual and future QST industrial applications, supply chain challenges, the current state of final markets, hypothesized outlooks, and underlying significant difficulties faced in strengthening coordination and excellence.
The report aims to provide an initial representation of the state of the art in national industrial sectors, offering a valid tool for discussion among all stakeholders of the Quantum Science and Technology system to support the development of an Italian research infrastructure and future strategic programs.

The Methodological Note

Several purposes drove creation of the database of firms that operate inside QST. In particular:

1. to investigate firms that effectively conduct research and production projects, utilizing QST properties;



2. to draw up a list of firms representative of the national QST business world;

3. to enlarge as much as possible the sample of organizations considered (as for geographical scope, as for sectors involved);

4. to gather up-to-date information about the organizations considered;

5. to have a set of variables on which to draw some first considerations.

It is possible to recognize several different steps in sampling. At the beginning of the *NQSTI* project, the author tried to define first reliable sources for the extraction of the firms interested in the research (TTOs' partnerships, scientific literature, economic and consulting reports, newspapers' articles, participation in Conferences and Technological Fairs).

Then the main activity was the definition of the QST activity of the organizations (product and services offered, or research project conducted). The third stage of the investigation was the collection and consolidation of the data and variables for all the firms of the sample and, finally, the elaboration of the first results. All the research activities have been developed between January 2023 and March 2025. In particular, it is possible to identify three specific phases in the collection of information on the QST companies.

Phase 1— the Technology Transfer Organizations panel

To start Quantum Science and Technology analyses in the Italian context, we begin collecting Information on the research collaborations put in place by all the partners participating in *Spoke 8* (15 TTOs)[4]. We started investigating companies that already cooperate or are about to start joint research and development projects with universities, EPRs, and foundations that are part of the *NQSTI* Extended Partnership. Obviously, we considered only companies that consider fields of applied research within the QST sectors and wanted to collaborate in these specific

[4] 15 are the organizations participating to *NQSTI* Spoke 8 "TT" are: *CNR- National Research Council, University of Naples – Federico II, Bruno Kessler Foundation, IIT - Italian Institute of Technology, Scuola Superiore Sant'Anna, Scuola Normale Superiore, University of Catania, University of Pavia, University of Padova, INFN – National Institute of Nuclear Physics, University Milano-Bicocca, University of Firenze, Sapienza University, University of Trieste, University of Camerino*.

scientific domains. The main questions were about the industrial sectors, the mechanism of cooperation, and the existence of shared IPRs.
First evidence of the elaboration of the dataset has been presented to the *First NQSTI Annual Meeting* (Rome, 15-16 January 2024). The dataset has been sent to the *Steering Committee* and to *Spoke 8* groups' coordinators to allow a discussion on the next steps to follow.[5]

Phase 2—the Cordis dataset

The *Cordis'* dataset[6] allows the investigation of information about EU research and development projects. Established in 1994, it gives free access to EU-funded research and innovation, where you can find data on projects, topics, and publications funded by the EU's research programs. *Cordis* belongs to the *Research and Innovation community platform of the European Commission*.
Science-based firms form public-private partnerships to join EU projects with the aim of addressing the most pressing challenges through concerted research and innovation initiatives. European Partnerships are a key implementation tool of *Horizon Europe* and significantly contribute to achieving the Union's political priorities, reducing the fragmentation of the research and innovation landscape[7].
It has special meaning, consequently, to analyze the private partners that participated in the European research programs.

Dataset - HORIZON EUROPE - Projects with at least an Italian organization (Public or private)
Extraction date: 14th May 2024 (from the beginning of 2021 to)
Keyword: Quantum
Total number of projects extracted: 197
Total number of projects analyzed for the discussion: 183[8]
Main Information: abstract, financial measure, research fields, typology of the organization, dimension of the firm, dimension of the investment, network of organizations (participating institutions), beginning and end of the project.

The cleaning of the dataset has been realized through reading the project abstracts. Particularly, several research projects contained the words "quantum leap" in the description. Some projects have as core research activities directly linked to QST, other research programs investigate, on the contrary, specific problems through the QST lens (partially, not as core research activity).

Phase 3—the NQSTI dataset consolidation

After completing the dataset with information available in institutional reports, in consulting and technological literature, specialized magazines, and the companies participating in TT and technological events, the scientific literature on QST was collected (see Bibliography). The reports describing QST sector structure in a general way or presenting specific industrial fields (sensing, computing, imaging) were then investigated. Still, to have an idea of the companies

[5] From the first meetings of the participants emerged clearly that there were Disclosure Agreements between PROs and companies that limited the complete gaining of the Information on Technology Transfer Mechanisms and partnerships.
[6] https://cordis.europa.eu. Accessed May 2024.
[7] https://research-and-innovation.ec.europa.eu/funding/funding-opportunities/funding-programmes-and-open-calls/horizon-europe/european-partnerships-horizon-europe_en. Accessed September 2024.
[8] Consequently, 14 projects are not considered for this analysis, specifically: *ANDREAH* (101046846), *ARCHIMEDES* (101057527), *CUE-GO* (101058349), *ELOQUENCE* (101094065), *ETTS* (101096405), *EVAI* (101104404), *IMPACT4MECH* (101112118), *ISPLASH* (101112295), *MAPWORMS* (101114050), *MEETWEEN* (101116257), *NEXTGEM* (101135916), *OLAMUR* (101135916), *PRESTO* (190181809), and *QUANTUM* (190190195).

directly involved in the QST research, the datasets belonging to *Quantum Flagship* (*Quantera*[9]), *QUIC* (*Quantum Industry Consortium*[10]) and *EPO* (*European Patent Office*) reports (*EPO*, 2023a; *EPO,* 2023b) have been analyzed.
Participants in international trade fairs and conferences are another meaningful source of QST firms. Trade fairs always show companies active in different markets, looking for new clients, new partnerships, and new collaborations. Firms participating in several workshops, summer schools, and public-private meetings were considered.[11]
The various sources gave birth to a first list of private organizations that exploit QST. Many firms, of course, were cited several times in the papers, in the economic reports and on the websites. For every single company, the authors preliminarily verified whether the firm belonged to the QST sector (in the case of non-specific events). They gathered this information through the official website that describes the products, or the services offered, the markets served and the research processes they are conducting. In the case of companies' websites that resulted poor in the description of the activities or, on the contrary, too big to understand if there exists a direct link to QST, they made use of other references, particularly of newspapers and magazines' articles (interviews and business case studies presented on the firms' websites on the page "Press releases or media").

The variables and limits

The information gathered for all the companies in the sample is:

- *Business name;*
- *Head Office (city, state);*
- *Websites URL;*
- *Dimension: spinoff, SMEs, other;*
- *Year of establishment;*
- *Short description of the products or services offered (mission);*
- *ATECO codes;*
- *Markets served;*
- *QST sectors;*
- *Others (general notes).*

To have a clear classification of the QST fields, the author followed the taxonomy realized by *CEN-CENELEC* exposed in van Deventer *et al.* (2022)**.** The representation of the QST pillars made to orient standardization actions at European levels illustrates a simple and shared description of the main quantum sectors (a schematization of the model is offered in the first Chapter, *figure 5*). It has been decided, nevertheless, to consider only the platforms and systems classification.
The dataset aims to represent a first step through the gathering and analysis of the QST Italian Industrial System. Authors hope in the next editions to add other relevant sources of information, such as VCs' investments in the national territory or specific IPRs analysis.
